

Bright solutions one after the other

### Lacquered Strip for Ceiling Systems

Cooling ceiling

The lacquered aluminium strip used in interior construction work clearly shows what consistent product development can achieve: it combines outstanding material properties with a wide range of colours. For years, lacquered strip has proved its worth as an ideal material for ceiling

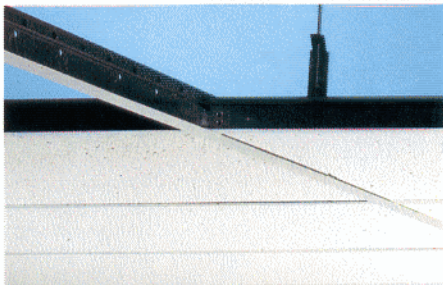

Ceiling panel

systems. Our wide assortment of colours allows the fashioning of customised solutions – all the ceiling systems we produce can be matched harmoniously with their surroundings. The lacquering systems used ensure a long service life.

Aluminium has certain advantages over other materials which allows it to be used universally. Aluminium panels are non-magnetic which makes them highly suitable for use in electronic data processing rooms. The low weight of lacquered strip saves the need for expensive constructions yet guarantees high stability.

In mineral fibre ceilings, so-called "capping strip" is used, i.e. narrow, thin-rolled, lacquered strips of aluminium which cover the T-rails of the support structure and enhance the decorative appearance of the ceiling.

Capping

New developments at Alu + Colour are in keeping with modern trends and offer solutions which are both functional and convincing. Cooling ceilings, for example, are an alternative to air-conditioning; their shaped and lacquered surfaces also make rooms look more attractive. VAW supplies the input material for these products in a variety of thicknesses and lacquer variations to meet customers' individual requirements.
