

Bright solutions one after the other

### Lacquered Façade Strip

For decades, VAW has been marketing lacquered façade strip as a modern material com-

bination. It is used as cladding for roofs and walls, mostly in the form of corrugated or trapezoidal-shaped sheets. Due to the material's low weight, even large surface areas can be covered easily.

The wide range of colours and the quality of our lacquering systems – which conform to the guidelines of the ECCA – give home owners and architects almost complete artistic freedom and such possibilities as:

- Single protective lacquer coating
- Two-layer polyester systems
- Various PVDF lacquer coatings
- Reverse-side lacquer coating for optimum polyurethane adhesion.

Aluminium curtain wall panels, due to their rigidity, corrosion resistance and resistance to fading, are extremely durable. Their service life is improved even further by using the most appropriate lacquering system. These advantages, combined with the fact that aluminium curtain wall panels require little care and maintenance, make them economically viable in the long run.

### Other Lacquered Applications

An ever increasing number of products make use of the advantages of aluminium, especially when combined with colour: table-tennis tops and road signs are just two of many examples.

The skylight is another outstanding example of this material combination – aluminium and colour. The aluminium layer not only provides optimum protection against the weather – since it is absolutely corrosion-resistant – but can also be coloured to match its surroundings exactly.

In addition, the alloys currently in use have much better properties than the previously used com-

mercial-purity aluminium. The strength, formability and, above all, corrosion resistance of aluminium have improved markedly as a result of continuous materials development.
