

Bright solutions one after the other

Lacquered Strip for Roller Shutters

Aluminium plays an increasingly important role in the manufacture of roller shutters. Compared with other materials, aluminium possesses excellent material properties, for example, low weight and high strength. VAW combines these material advantages with a wide choice of colours then enhances them by means of an appropriate lacquering system.

Aluminium roller shutters are light, rigid and durable. Their low weight makes them easy to operate – an important criterion considering the extensive width of many shutters.

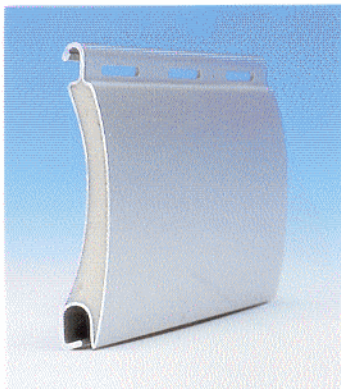

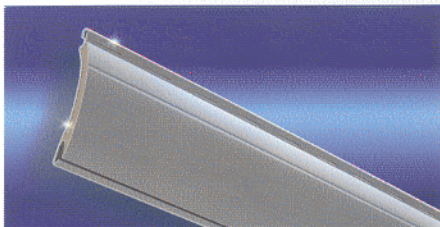

Aluminium strip is produced using a one-coat or double-coat lacquering system. In the double-coat lacquering variant, the customer can choose between a primer/finishing coat or a base lacquer/clear lacquer version.

We supply a wide selection of colours, ranging from standard tones to individually fashioned colours on request. This broad range of colours allows aluminium roller shutters to be integrated harmoniously into any design concept, matching both interior architecture and façade.

The design possibilities extend beyond the range of colours. Different sized windows

require different shapes. We, therefore, offer customised solutions with regard to thickness and width.

Lacquered strip for double-walled, roll-formed slats and roll-formed strip for roller shutter casings are today an essential part of protection against the sun.
